

About Universal

Universal Software is a leading provider of global software engineering, customization & integration services. We are focused on enabling our clients with the best IT infrastructure to suit their needs, in a timely fashion and at the best value. With its presence in the United States and India, Universal can provide you with quality service to suit your needs, from consulting to outsourcing.

Universal's encompassing SAP R/3 offering

SAP R/3 system deployment

Implementing any ERP solution across a whole enterprise is a daunting task, especially when using a complete and complex solution such as SAP. This is why you need to count on Universal's elite IT Consultants. We provided some of the largest global companies with senior professionals, all of whom had years of experience deploying SAP R/3 with specific module knowledge. Involved in back-end management as well as front-end implementations (reports, smart form design) and EDI integration, they made sure that our clients would be able to fully leverage their SAP functionality.

Module customization

IT solutions should adapt to your specific business model. Whether it is customizing billing documents to specific plants or designing layout sets for quotations at a world-renowned consumer products company, or developing new features to better handle promotions and discrepancies at a food processor and distributor, our Consultants have a successful track record for adapting SAP systems to your needs, on-time and on-budget.

Legacy system migration

Fluent in a variety of languages (ABAP/4, COBOL, C, C++, Java, ABAP/4...) across a wide variety of operating systems (different flavors or UNIX, Citrix, Windows) and databases (including Basis, Oracle, Sybase, Informix), our "IT Gurus" have the knowledge and experience required to help you transition your data and processes from previous systems to SAP. In fact, we even helped one of the largest IT companies in the world successfully interface its SAP solution with its legacy systems (distribution, billing...), thereafter smoothly phase those resources out as they were replaced by corresponding SAP modules, one at the time.

Third-party software integration

Last but not least, our vast experience in software integration enables us to integrate your existing applications to your SAP architecture, thus building a robust IT infrastructure to maximize and expand the capabilities of your ERP system. For example, we integrated Nextlinx Automated Global Trade Management to internal SAP systems in both the US and Japan at a multibillion dollar high-tech manufacturing company, and enabled the creation of reports on standard Lotus Notes templates at a leading consumable company.

Our SAP expertise includes

Modules

- SD (Sales & Distribution)
- MM (Materials Management)
- BW (Business Warehouse)
